Exercise — PostgreSQL CRUD from PyCharm

Create a PostgreSQL database:

```
CREATE DATABASE library_store;
```

Connect to `library_store` and create this table:

```
CREATE TABLE books (
    book_id INT PRIMARY KEY,
    title VARCHAR(100),
    author VARCHAR(100),
    category VARCHAR(50),
    price DECIMAL(10,2),
    stock INT
);
```

That is the only preparation to do in PostgreSQL.

Everything else should be done from **PyCharm**.

Create a project:

```
library_crud_project
```

Install:

```
python -m pip install psycopg2-binary
```

Create:

```
main.py
```

Tasks

1. Connect Python to PostgreSQL using `psycopg2` .
2. Print:

```
Connected to PostgreSQL successfully
```

after the connection is established.

3. Insert these 4 books from Python:

```
201 | Atomic Habits        | James Clear       | Self Help   | 650  | 12
202 | Clean Code           | Robert Martin     | Technology  | 900  | 8
203 | The Alchemist        | Paulo Coelho      | Fiction     | 500  | 15
204 | Deep Work            | Cal Newport       | Productivity| 700  | 10
```

4. Read and display all books.
5. Display only books from the `Technology` category.
6. Display books whose price is greater than `600`.
7. Update the price of book `202` to `950`.
8. Update the stock of book `204` to `14`.
9. Display the updated records.
10. Delete book `203`.
11. Display all remaining books.
12. Add one new book of your own choice.
13. Find the book with the highest price.
14. Find the total stock available across all books.
15. Count how many books exist in each category.
