```
import pandas as pd

data = {
    "Employee": ["Aisha", "Rahul", "Neha", "Omar", "Priya", "Karan", "Fat
    "Department": ["HR", "IT", "Finance", "IT", "HR", "Finance", "IT", "H
    "Training_Hours": [12, 18, 10, 22, 15, 8, 20, 14],
    "Assessment_Score": [78, 88, 72, 91, 84, 69, 95, 80],
    "Completed": ["Yes", "Yes", "No", "Yes", "Yes", "No", "Yes", "Yes"]
}

df = pd.DataFrame(data)

print(df)
```

Exercises

1. Display the complete DataFrame.
2. Display only the first 4 rows.
3. Display only these columns:

```
Employee
Assessment_Score
```

4. Show only employees from the **IT department**.
5. Show employees whose **Assessment_Score is greater than 80**.
6. Show employees who completed the training:

```
Completed = Yes
```

7. Show employees who:

- belong to IT
- and scored above 85

8. Create a new column called:

```
Passed
```

Condition:

```
Assessment_Score >= 75
```

Store:

```
Pass
Fail
```

9. Find the **average assessment score**.
10. Find:

- highest assessment score
- lowest assessment score

11. Find the **average training hours**.
12. Sort employees by `Assessment_Score` from highest to lowest.
13. Group by `Department` and find the **average assessment score**.
14. Group by `Department` and find the **total training hours**.
15. Count how many employees belong to each department.
16. Count how many employees completed training.
17. Using NumPy, take the assessment scores:

```
scores = df["Assessment_Score"].to_numpy()
```

Find:

- mean
- maximum
- minimum
- standard deviation

18. Create a **bar chart** showing average score by department.
19. Create a **bar chart** showing total training hours by department.

20. Create a **Seaborn chart** comparing:

`Department vs Assessment_Score`
